# A new dataset of single-turn conversations + situational information

**Proactive conversational assistance:** Addressing the implicit user goal

# Highlights

We represent situational information by free-form English texts. Six semantic categories: location, possession, time/date, ... We introduce a dataset of **1,760** single-turn conversations. Language: English Target scenario: help-seeking (user request  $\rightarrow$  proactive response) Crowdsourcing + Language generation model + Manual verification Our experiments show that response systems can be misled by distractors. Selection accuracy decreases only with ~5 irrelevant statements in input.

# Representation of Situation: Short English statements that describe observable facts of the current world state

Definition	Example
Information about the user's current location	The user is home. / The user is in the kitchen. / The user is in the office.
Information about what the user possesses	The user owns a car. / There are apples in the kitchen.
Information about time	It's midnight now. / It's morning now.
Information about date and season	Today is the user's birthday. / It's summer now.
Information about the user's behavior	The user just woke up. / The user has a flight to catch this afternoon.
Information about non-user entities and eventualities	The room temperature is hot. / The user's car has a flat tire.
	Information about the user's current location Information about what the user possesses Information about time Information about date and season

### **Resource collection pipeline:** Crowdsourcing + Language Generation model + Manual verification

		Utterance Please turn on the TV. $(u)$			
OpenSubtitles English request phrases (1) Seed utterance $(u)$ and goal $(g)$ selection ConceptNet [start]	$\begin{array}{c} & & \\$	(4) Response validation $u, g, valid r_1$ (5) Situation collection II Collect situations for $(u, g, r_1)$ $(= S'_1)$	Situations	It is evening now. [user] is home. [user] is in the living room. [user] is sitting on the couch. [user] has a TV in the house. [user] has an outfit on the bed. [user] has drinks and snacks in the kitchen. [user] has game cards on the shelf. The TV is off.	( <i>S</i> )
u, g, R, S       SUGAR [end]   (8) Validatio	n (7) Distractor selection $(= r_2, r_3, \dots, r_m)$ (Adversarial filtering)	(6) Semi-automatic situation collection Expand $S'_1$ (= $S_1$ )		[someone]'s birthday is today. There are several sports games available to watch. There is a basketball game scheduled.	

	There is a	basketball	game sch	neduled	•
--	------------	------------	----------	---------	---

Responses Sure. Would you like me to check today's sports listings? (Best)  $(r_1)$ Sure. Shall I pour a drink and bring some snacks for the game? (Acceptable)  $(r_2)$ Sure, shall I select an outfit for you?  $(Bad)(r_3)$ 

Response Selection Experiments: RQ: Can systems use situational statements to find optimal responses?

+ Situational info. ■ + ~5 Distractors Input utterance only

**Relevant situational statements gave a performance boost** 

When a few distractors were added, scores dropped by large margins

## Conclusion

- We introduced a new dataset of single-turn help-seeking conversations augmented with situational statements
- Our dataset was created through crowdsourcing and a neural language generation model followed by multiple manual verification steps.
- Response selection experiments show that systems can benefit from situational information but at the same time can be misled by distractors. **Future work:** 
  - (1) Exploring representations of situational information (multi-modal representations? adequacy?)
  - (2) Extension to response generation (Refer to our paper @ NLP4ConvAl workshop)
    - Naoki Otani, Jun Araki, HyeongSik Kim, and Eduard Hovy. 2023. On the Underspecification of Situations in Open-domain Conversational Datasets. NLP4ConvAl workshop (7/14)
